

Thank you for the purchase of the Matador Arms SKS Scout Mount.

INSTALLATION INSTRUCTIONS

SKS SCOUT MOUNT

IMPORTANT: Please ensure your rifle is unloaded prior to starting any work. Place your ammunition away from the workspace.

CAUTION: Only tighten the set screws to the point the mount is level with the bolt carrier! Over tightening this will cause damage to the sight and gun!

Step 1. In order to install the mount, the rear sight needs to be removed. To remove the rear sight, it helps to have the rifle clamped in a vise or secured somehow. Using a punch, remove the pin at the front of the sight housing. Apply downward pressure on the middle of the rear sight, use a small flat-bladed screwdriver, and pry the sight backwards while applying downward pressure to compress the sight. Once it is out, remove the spring plate as well.

Note: If you have trouble removing the rear sight, search www.youtube.com for SKS rear sight removal.

Step 2. Lock the bolt on the rifle open. With the rear sight and spring removed, slide the scout mount into the housing until the pin holes line up. This might require some light taps to go all the way in. Using the supplied spring pin, tap it into place to secure the mount. It might help to compress the pin; to get it started, use pliers or a small pair of vice grips. Make sure the pin is through so as not to interfere with the gas tube block.

Step 3. Using the supplied hex wrench and set screw, thread the set screw through the hole. Stop when it is at the bottom or you feel slight pressure! Close the bolt on the action of the rifle. Tighten the set screw until the scout mount is level with top of the bolt carrier.

Do not over tighten this as it may damage the mount!!

Install the second set screw on top of the first to prevent any chance of the first backing out. It is also possible to add a small amount of Loc-tite to these set screws if you wish, but it is not required.

The front sight may require some adjustment to align correctly with the scout mount.
